

CANADIAN HELI STRUCTURES LANGLEY 2004

SUPERTHERM® Ceramic Thermal Barrier Coating *Engineered to Repel Heat*

This stress skin pre-engineered structure is from Colony Buildings and David Thompson.

It was recommended to the customer to insulate the building with **SUPERTHERM**®.

The customer chose **SUNSHIELD**® which lacks the extra durability, fire and thermal protection provided by **SUPERTHERM**® but is less expensive.

The walls around the room containing the acid bath tanks were given a primer coat of **RUST GRIP**® first to protect against corrosive vapours.

The ceiling above the acid bath tanks was also coated with **RUST GRIP**® only to protect against the corrosive vapour's.
