

GARAGE FLOOR

This shop has in floor radiant heating. It was pressure washed first to a clean, dry and sound condition ready to accept a coating system. Then two applications of **SP INTERLOCK / INNERSEAL**® were applied at a net spread rate of 100 sf per gallon. This permanently seals the concrete from the inside out preventing any penetration of contaminants such as oil, grease, etc. It also strengthens the concrete by over 400% flexurally and 100% compressively to greatly reduce dusting, cracking and spalling.

24 hours later **NON-SKID**® - HIGH GLOSS, coloured light gray to the owners specification, was applied in 2 coats cross hatched at a net spread rate of 100 sf per gallon for an outstanding, chemical resistant and low maintenance finish
